

Spacing

Spacing scale		px
The spacing scale is used to distribute components across the page.		2
It is based on a 4px grid system, which uses multiples of 4 to define dimensions, padding, and margins of elements on the interface.		4
		8
To achieve a good visual rythm and convey a well structured hierarchy, use smaller spacing units between components that are closely related to each other, and larger spacing units between sections, complex components or groups of components that need to be visually differentiated.		12
		16
		20
		24
Use spacing consistently when applied to the same type of elements. For example, between form fields in a form, or between containers.		32
